

# 15TH EUROPEAN HEATHLANDS NETWORK WORKSHOP

Lowland heaths under pressure: *challenges in ecological restoration*

Aug 20 – 25/26 | 2017

Nijmegen | Dwingeloo | The Netherlands

# Concluding remarks on the 15<sup>th</sup> European Heathlands Network Workshop

Henk Siepel

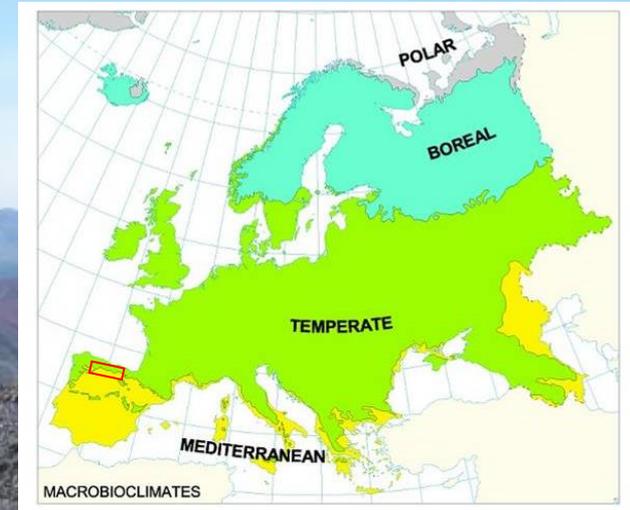

*Erica australis* heathlands

*Genista hispanica* shrublands

*Genista florida*  
shrublands

*Calluna vulgaris* heathlands

1. Ecotone Atlantic-Mediterranean
2. Uneven topography
3. Human management

# Building/Mature-PHASE

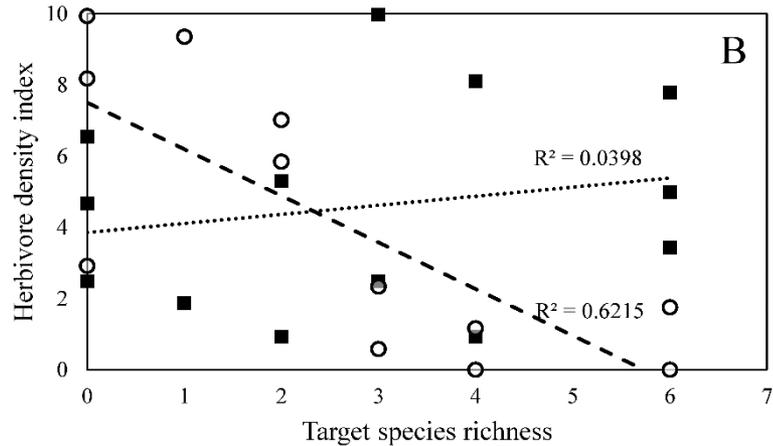

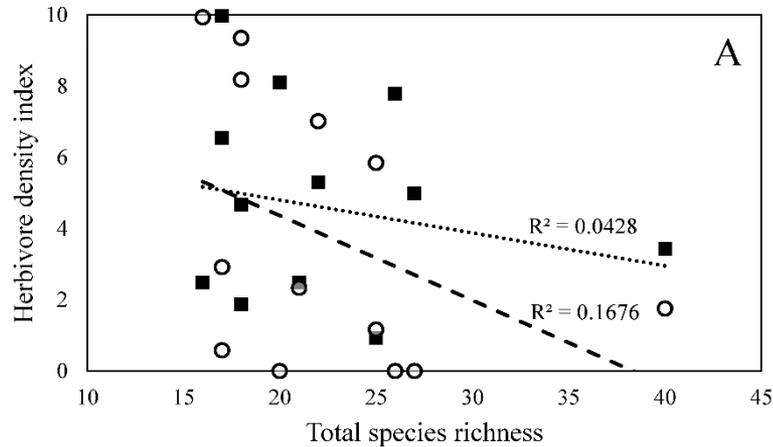

## Burning

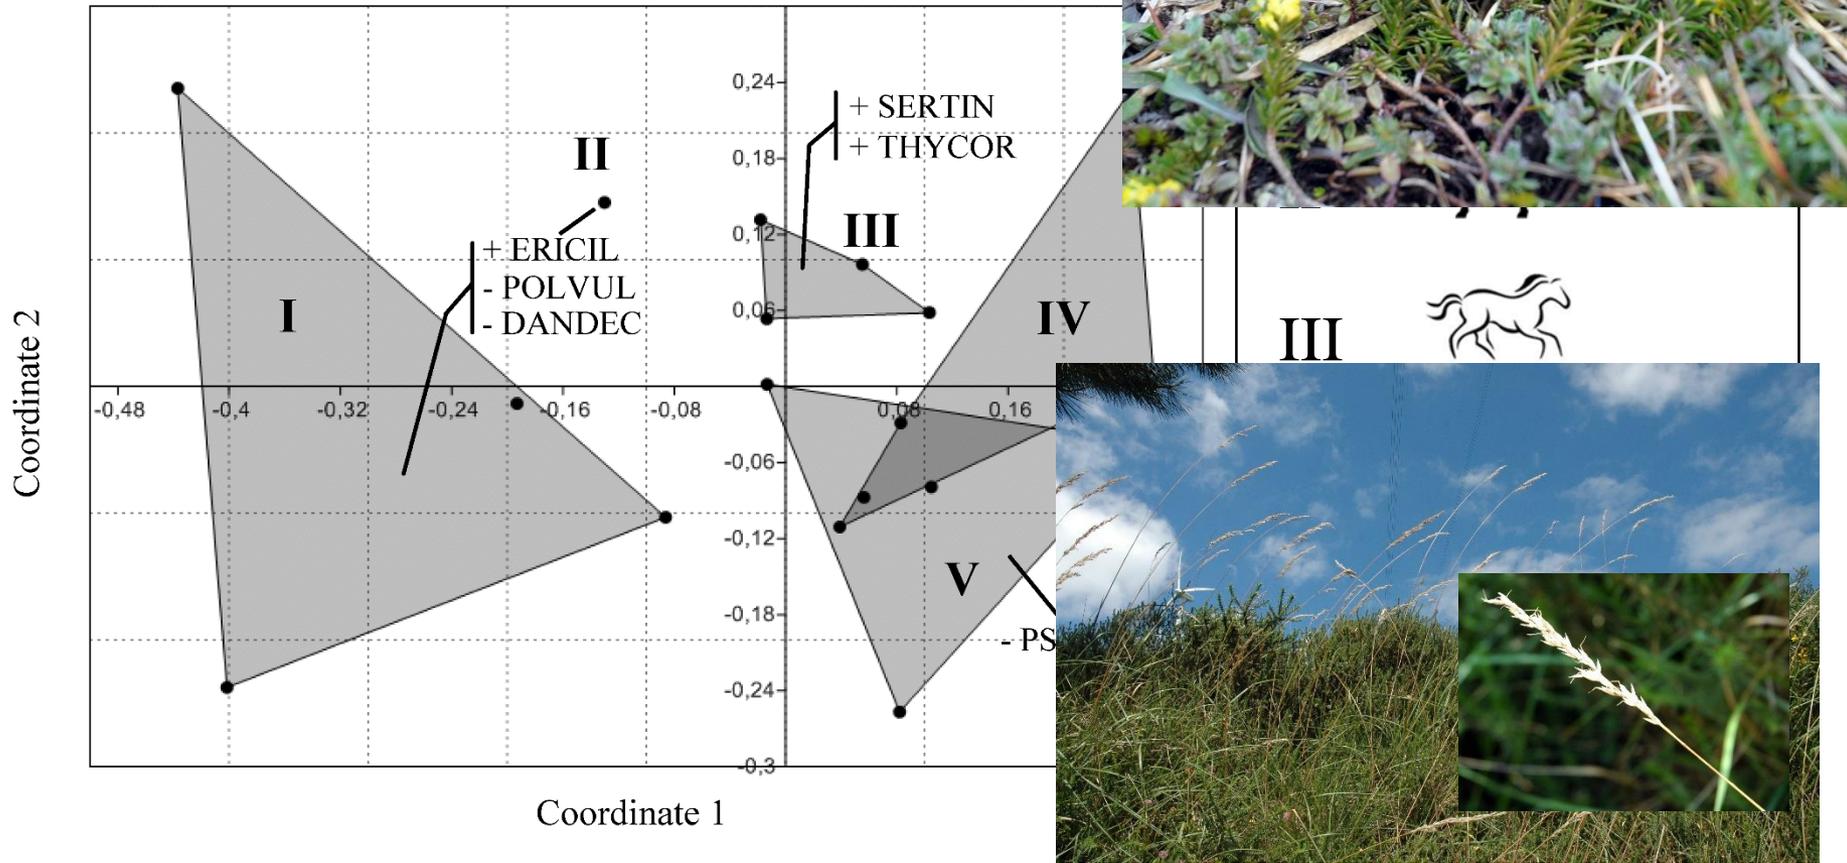

## Cutting

# Grazing levels impact species richness and diversity

# Grazing levels impact community composition

# Conclusions: Regeneration life cycle

Persistence of plants  
in growth stages

## Lifespan

### Primary cycle:

~ 8 - 15 years

### Regeneration cycle:

- **resprouting**

9 - 12 years ( + x)

- **layering**

5 - 15 years ( + x)

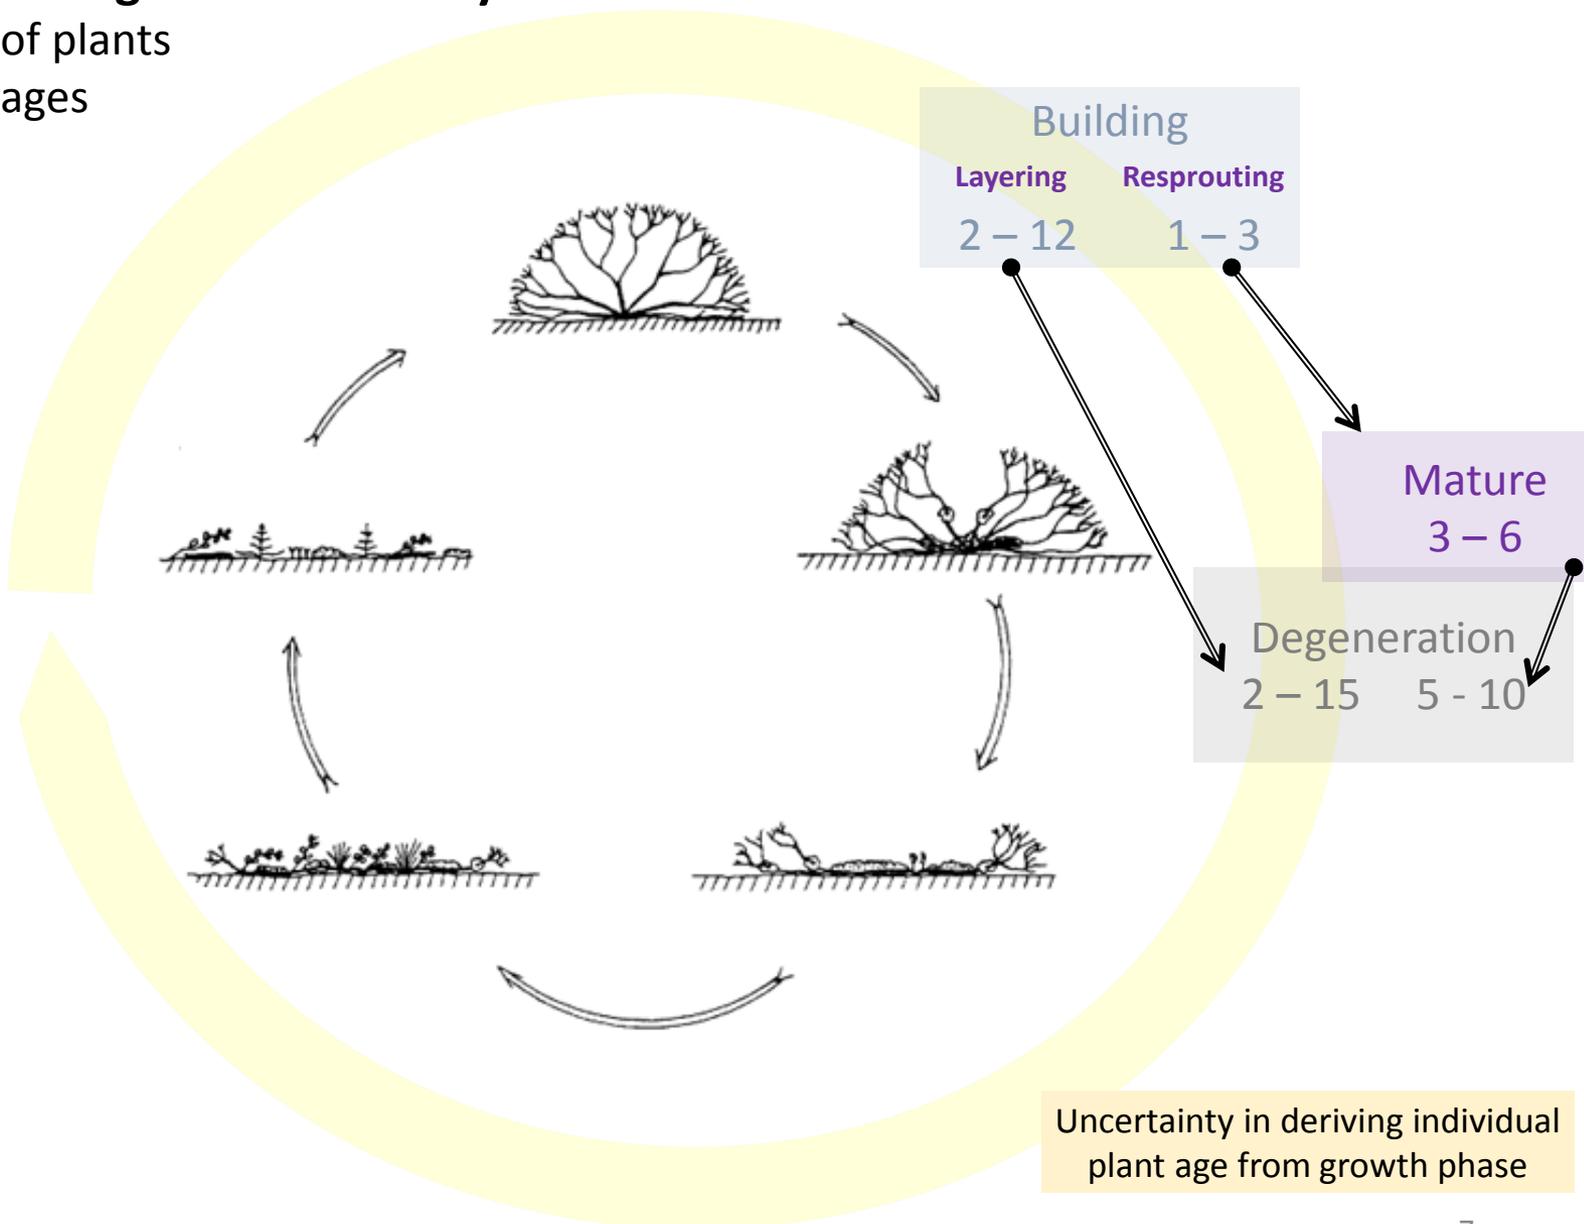

### „real life span“

19 - 25 years ( 1R)

20 - 30 years ( 2R)

**No evidence** for plants older than 28 years.

**No evidence** for more than two regeneration cycles.

# European habitats

## Dry heathland

- 2310 Dry sand heaths with *Calluna* and *Genista*
- 2330 Inland dunes with open *Corynephorus* and *Agrostis* grasslands
- 4030 European dry heaths
- 6230 Species-rich *Nardus* grassland

## Wet heathland

- 4010 Northern Atlantic wet heaths
- 7150 Depressions on the peat substrates of the Rynchosporion

## Bogs

- 7140 Quaking bogs and transition mires

## Aquatic habitats

- 3110 Oligotrophic waters containing very few minerals of sandy plains (*Littorelletalia uniflorae*)
- 3130 Oligotrophic to mesotrophic standing waters (*littorelletea uniflorae*)
- 3150 Natural eutrophic lakes with Magnopotamion or Hydrocharition -type vegetation

**Moor frog**

**Natterjack toad**

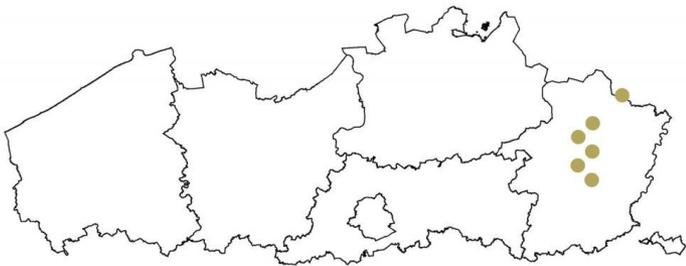

**Spadefoot toad**

## **Amphibians**

## **Dragonflies**

# Heaths near Toruń – military training area

# Forest succession

# Difference between pH measured *in situ* and in laboratory

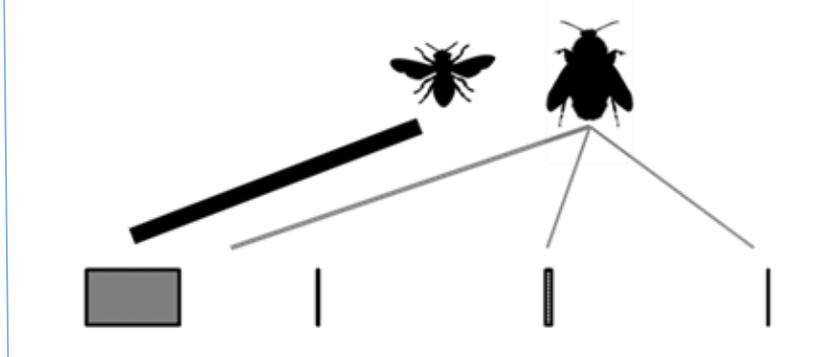

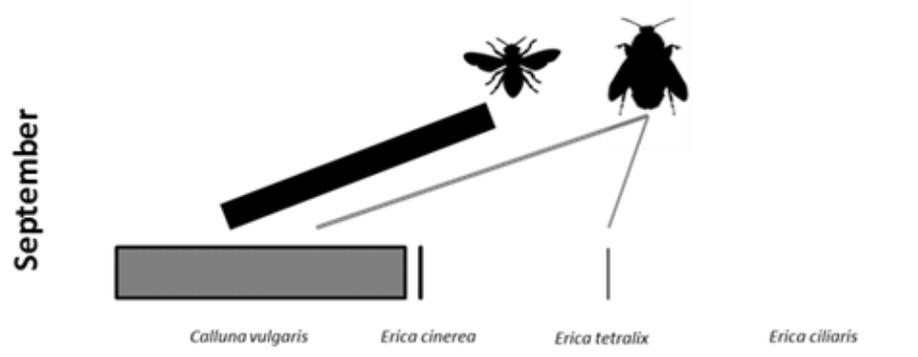

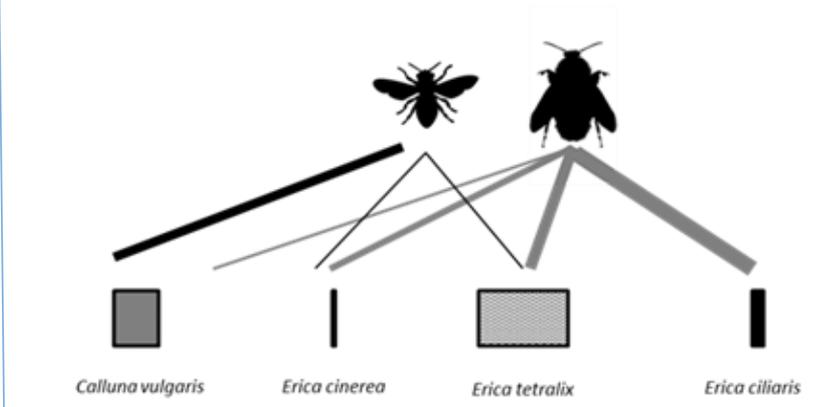

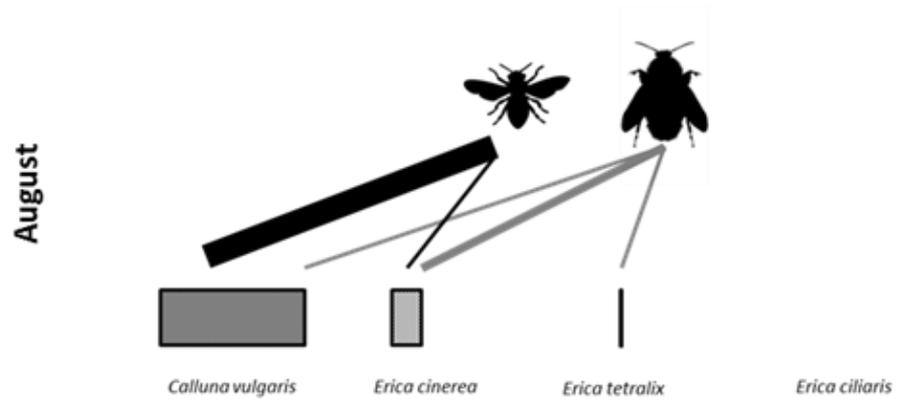

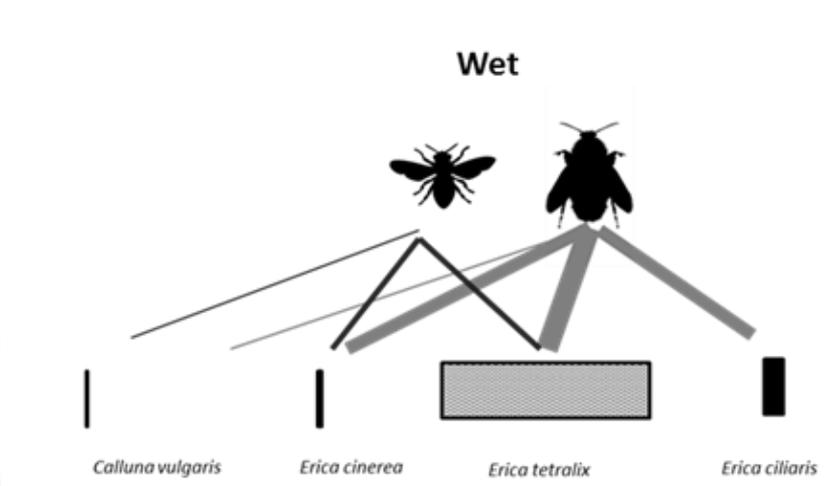

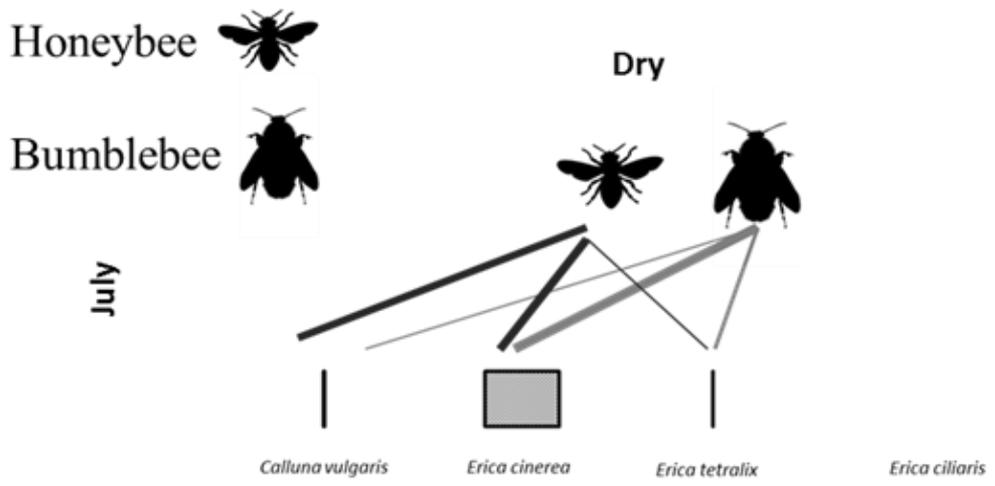

Date	Calluna <i>in situ</i>	Calluna laboratory	Calluna difference	Pinus <i>in situ</i>	Pinus lab.	Pinus difference
May n=8	<b>3.05</b>	<b>3.57</b>	<b>0.52</b>	<b>3.08</b>	<b>3.72</b>	<b>0.64</b>
June n=10	<b>2.91</b>	<b>3.64</b>	<b>0.74</b>	<b>3.10</b>	<b>3.95</b>	<b>0.85</b>
Aug. n=8	<b>3.17</b>	<b>3.62</b>	<b>0.44</b>	<b>3.14</b>	<b>3.60</b>	<b>0.46</b>

# Smoke-induced germination across heathland flora

Sigrid S. Bruvoll

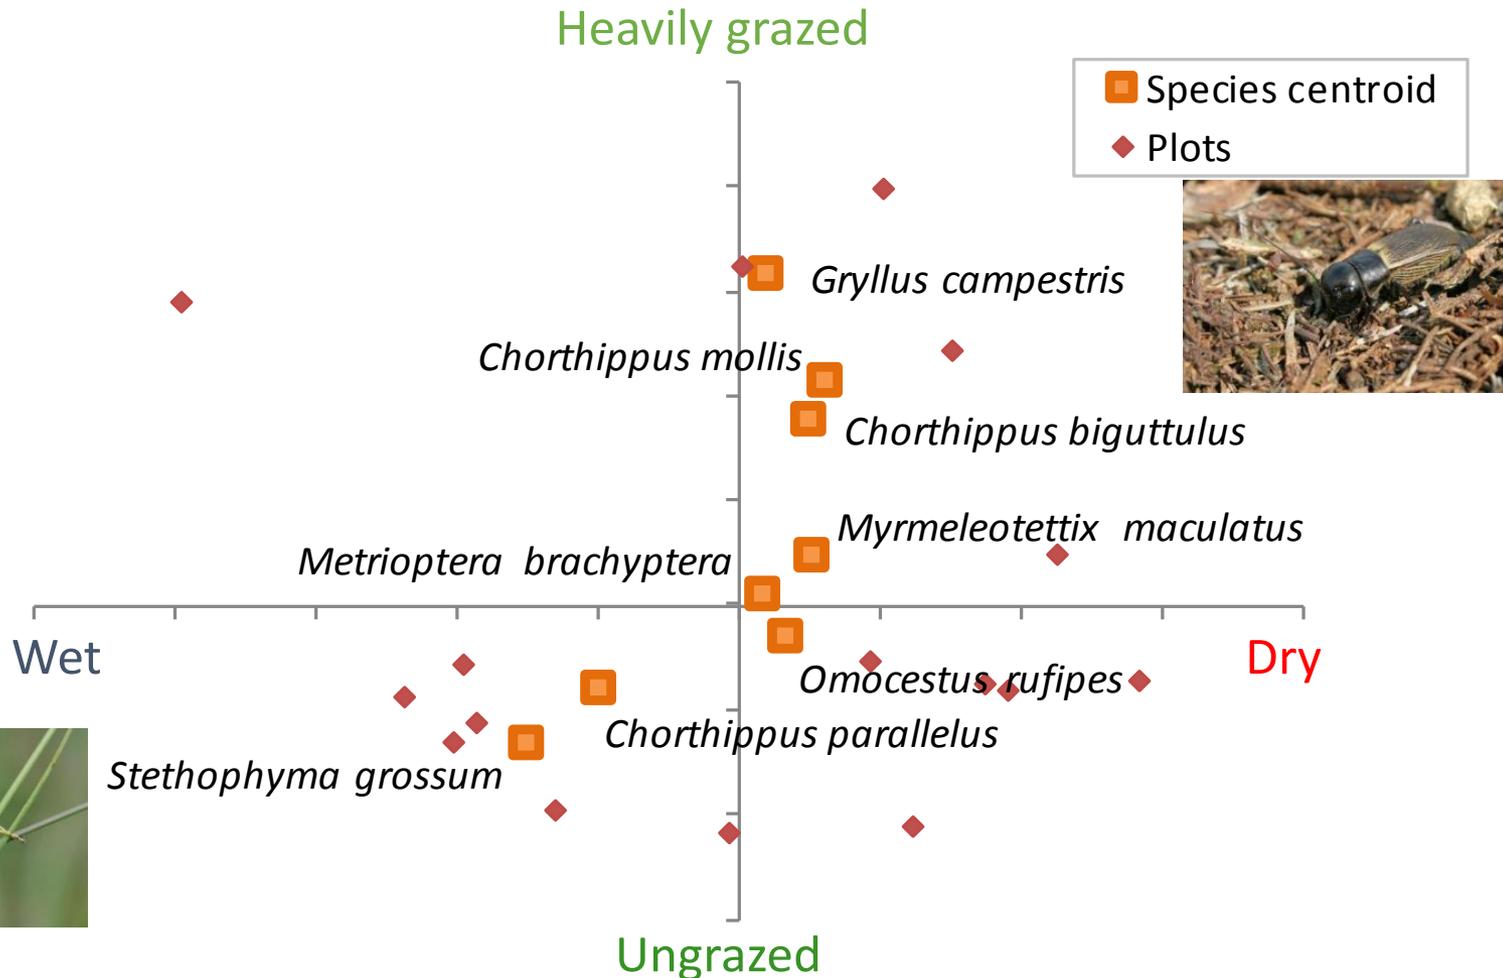

<b>Species tested</b> (2 dwarf-shrubs, 5 forbs, 11 grams)	<b>18</b>
<b>Smoke responses</b>	<b>14</b>
<b>Coast &gt; inland</b> (heath 1; forbs 4; grams 6)	<b>11</b>

(Bruvoll 2016)

# Species ordination: *Grasshoppers*

(6 Early, 5 Late successional species)

# Increment of birch and aspen within two years

	<i>B. pendula</i>		<i>P. tremula</i>	
	Grazed	Fenced off	Grazed	Fenced off
Heathland	26 ± 6*	38 ± 10	1 ± 5	1 ± 9
Basophilic Grassland	17 ± 10	16 ± 9	0 ± 5	8 ± 3

\* Mean height increment from 2014 to 2016 in cm ± standard error

# Recommendations for management of pioneer trees

-> Mechanical removal of trees appears inevitable

-> Birch stumps shoots should be removed in first summer after felling

-> Shoot removal should (if possible) be implemented during vegetation period

SHEEP AND GOAT CONSULT

# EWES LOVE BIRCH

ESPECIALLY IF  
THEY  
USUALLY  
HAVE GRASS

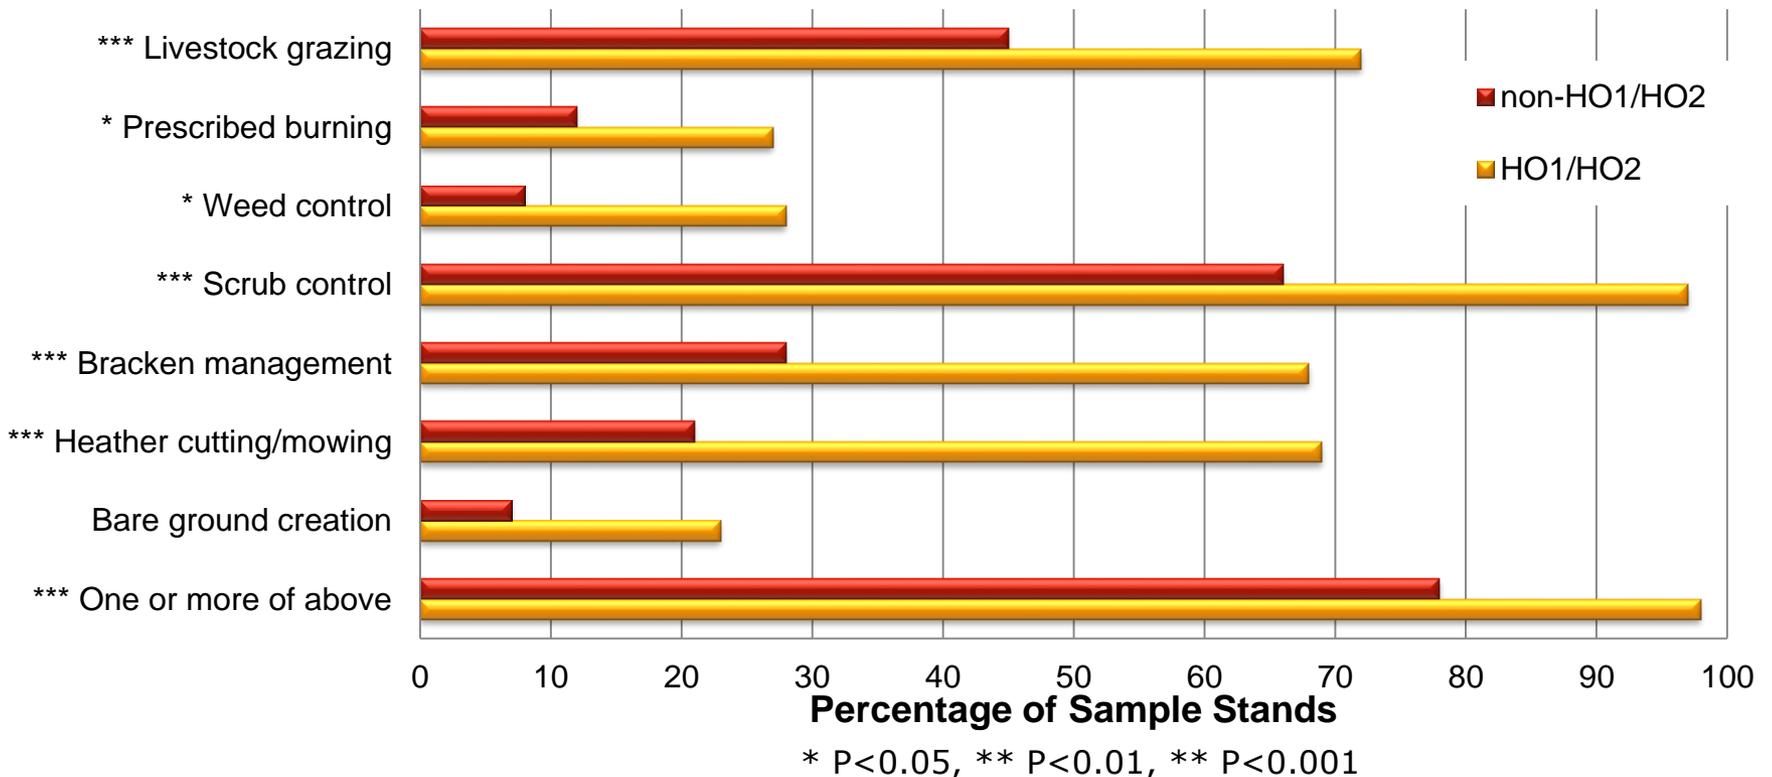

# Conclusion

The Heathland Farm is a concept for the system restoration and innovation of nature conservation and food production through cultural heritage.

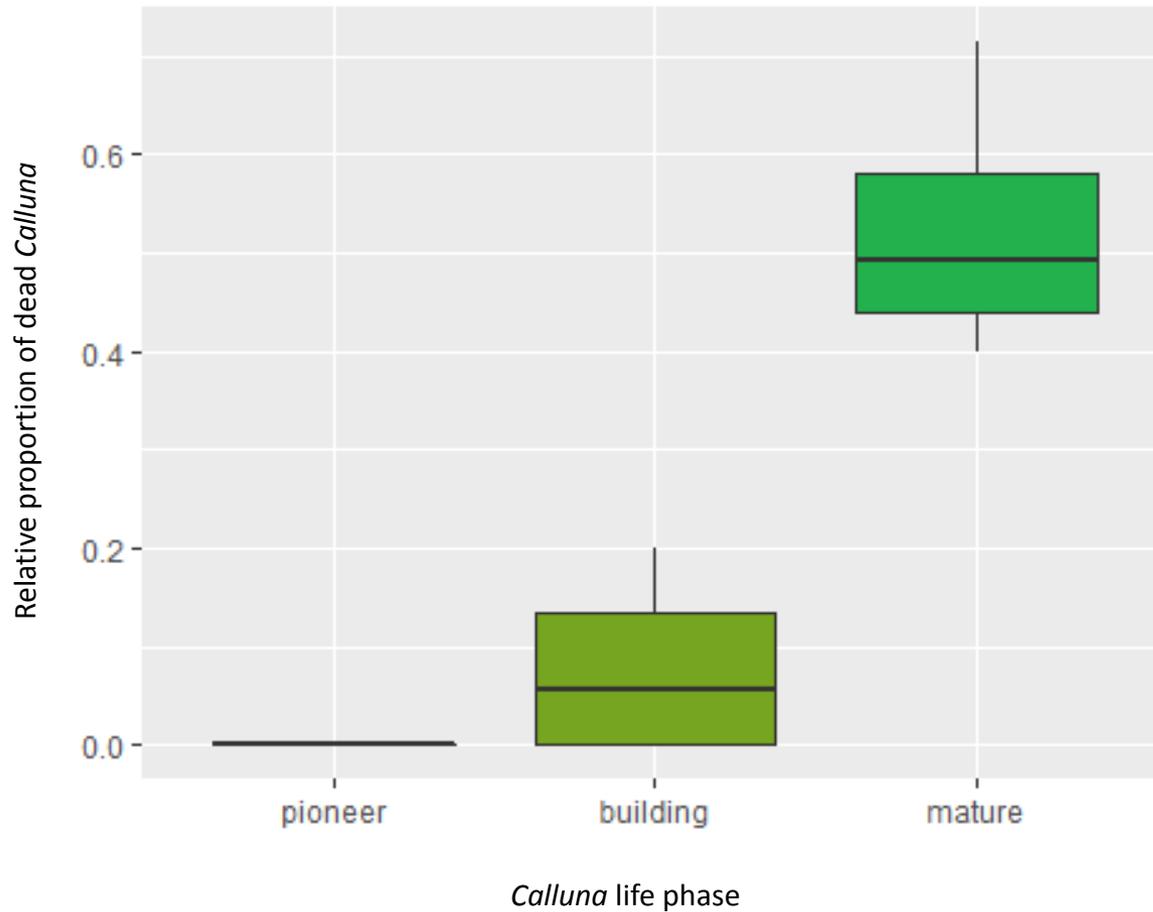

# What were the general impacts of the agreements?

Sites within agreements had more positive management, resulting in more condition targets improving (more bare soil, positive indicators increasing and negative decreasing).

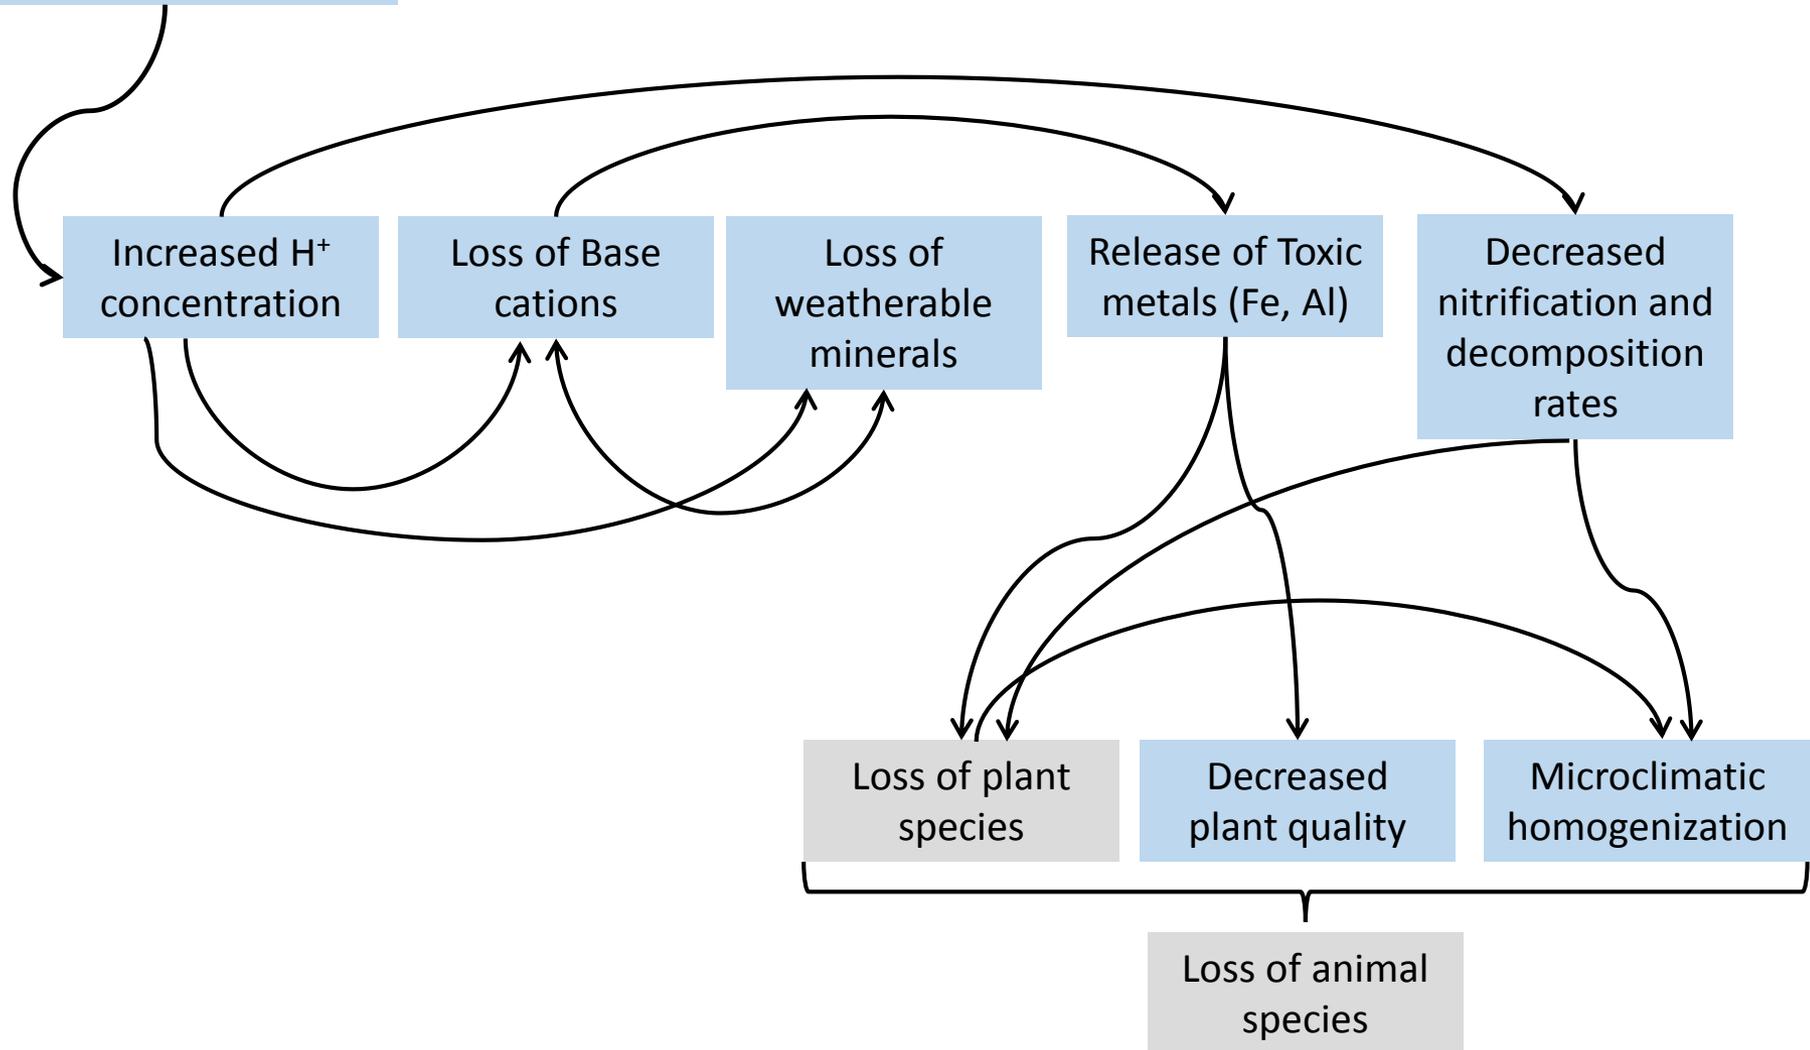

Lüneburg Heath	Combat non-target species	Target community restoration	Effects on seed bank	Nitrogen removal	NP-ratio	Cost-benefit ratio	Appreciation
<b>Grazing</b> 							
<b>Mowing</b> 							
<b>Prescribed burn.</b> 							
<b>Chopping</b> 							
<b>Sod-cutting</b> 							

# Drought damage & land use gradient

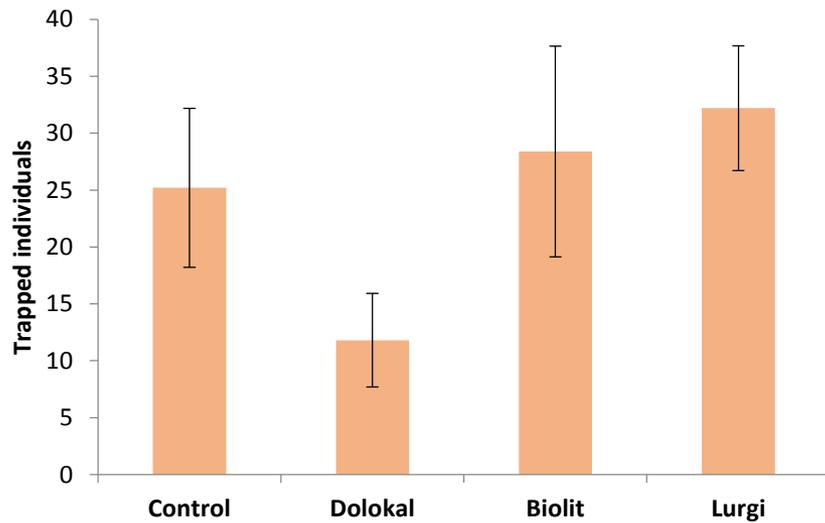

# The soil acidification cascade

Soil acidification

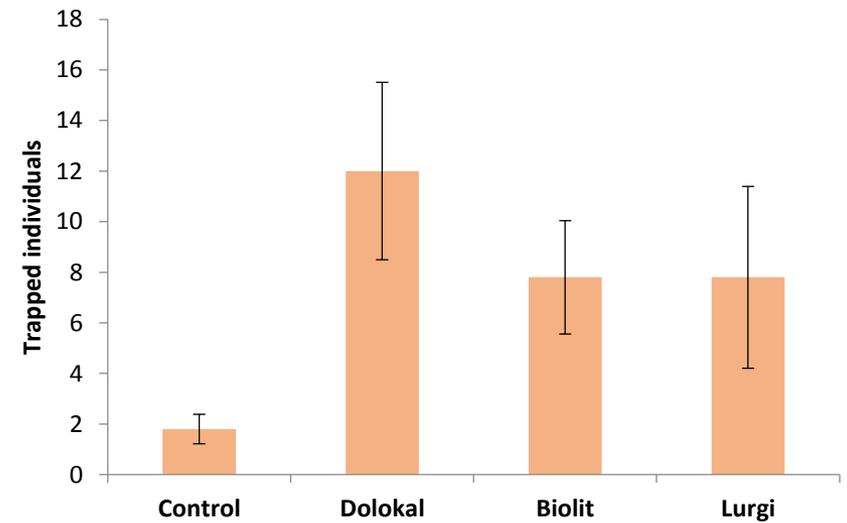

# Preliminary results: invertebrates

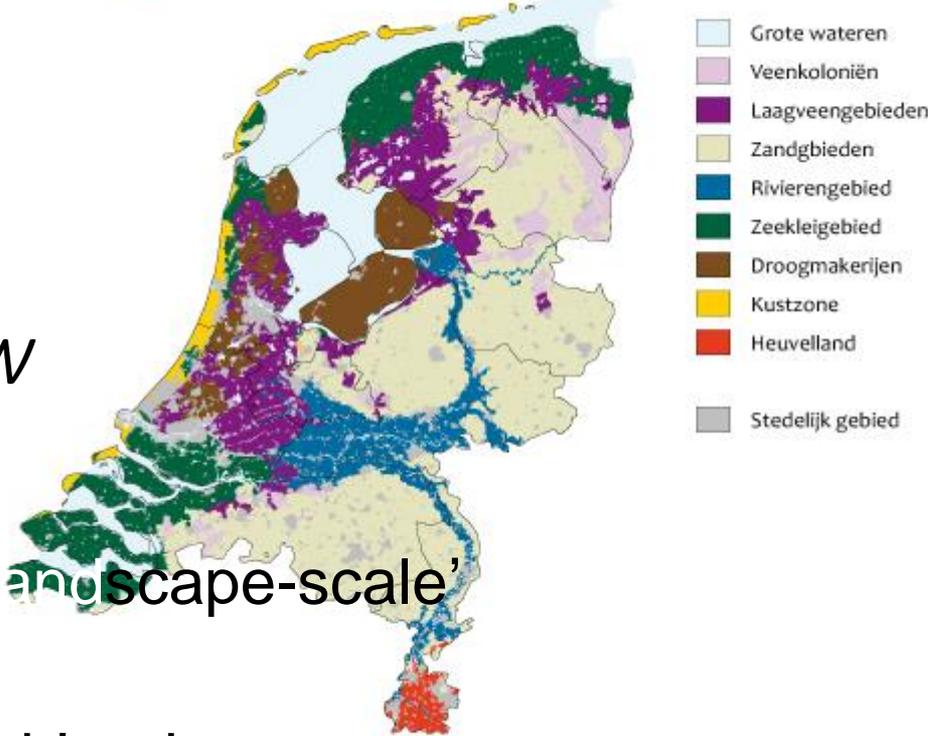

## Herbivorous diptera

## Detritivorous diptera

# OBN Knowledge *netw*

- 8 Expert Teams (ET's) at 'landscape-scale'
- 3 ET's are relevant for heathlands
  - Dry sandy areas (drift sands dunes, heathlands, woods)
  - Dunes and coastal areas (grey dunes)
  - Wet sandy areas (heathlands, fens, bogs)

- ET's have a tripartite composition: **triangle**

*sitemanagers*

*researchers*

*policymakers*

# Wins of OBN Knowledge network

## ▪ Policymakers

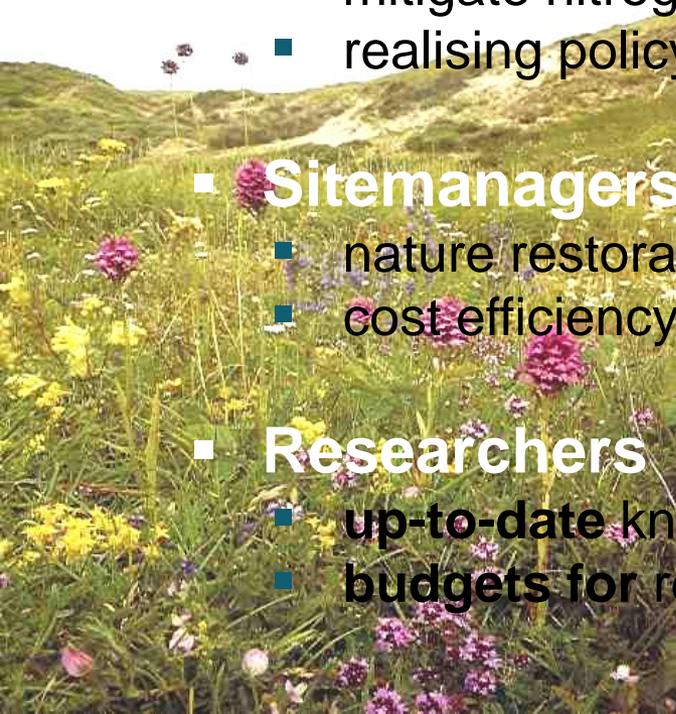

- independant/recent/validated knowledge on measures to mitigate nitrogen deposition in N2000-areas (court!)
- realising policy goals N2000, WFD, GAP

## ▪ Sitemanagers

- nature restoration N2000-areas, red list species
- cost efficiency management

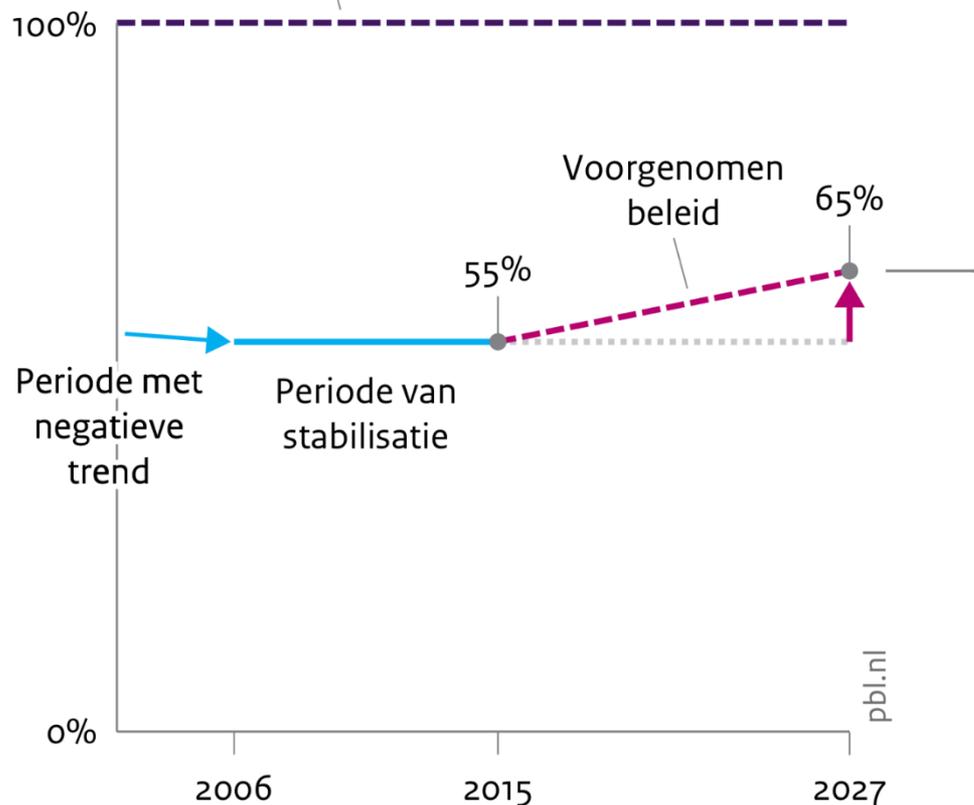

## ▪ Researchers

- **up-to-date** knowledge; exchange with other diciplines
- **budgets** for research and (a little bit for) publications

# Effect on biodiversity

Volledig doelbereik Vogel- en Habitatrichtlijn

Bron: PBL

# Work to be done

## Tasks Province

- Drafting of management plans
- Mapping of habitat types
- Implementing management
- Restoration measures
- Research
- Communication
- Enforcement and licensing

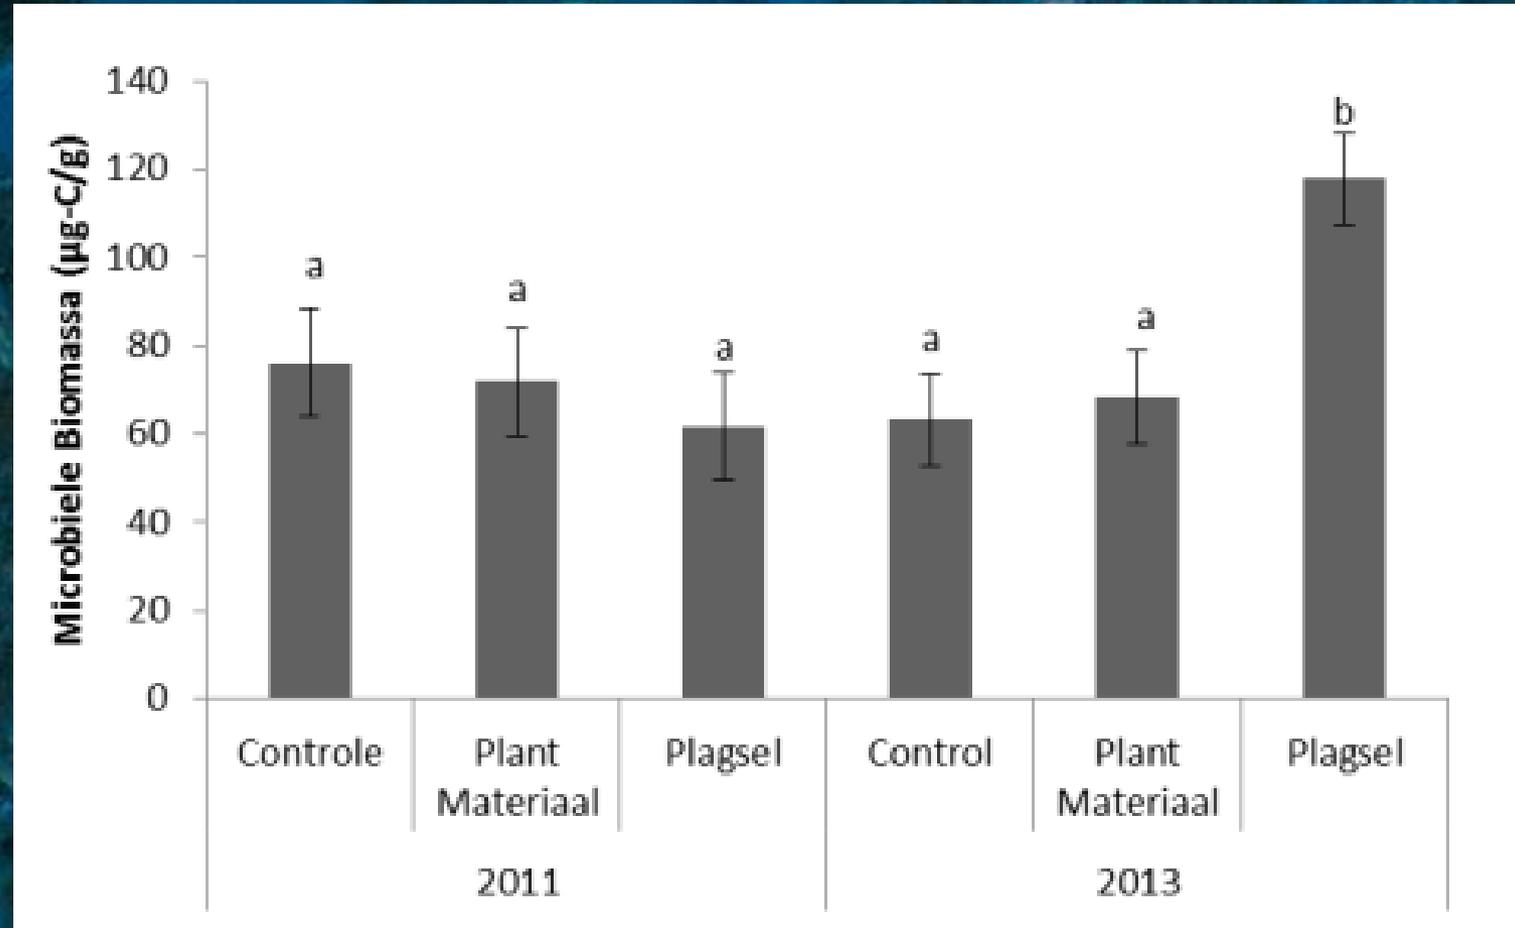

## Beheerplan Holtingerveld

Oerlandschap, gekneed door ijs en oorlog

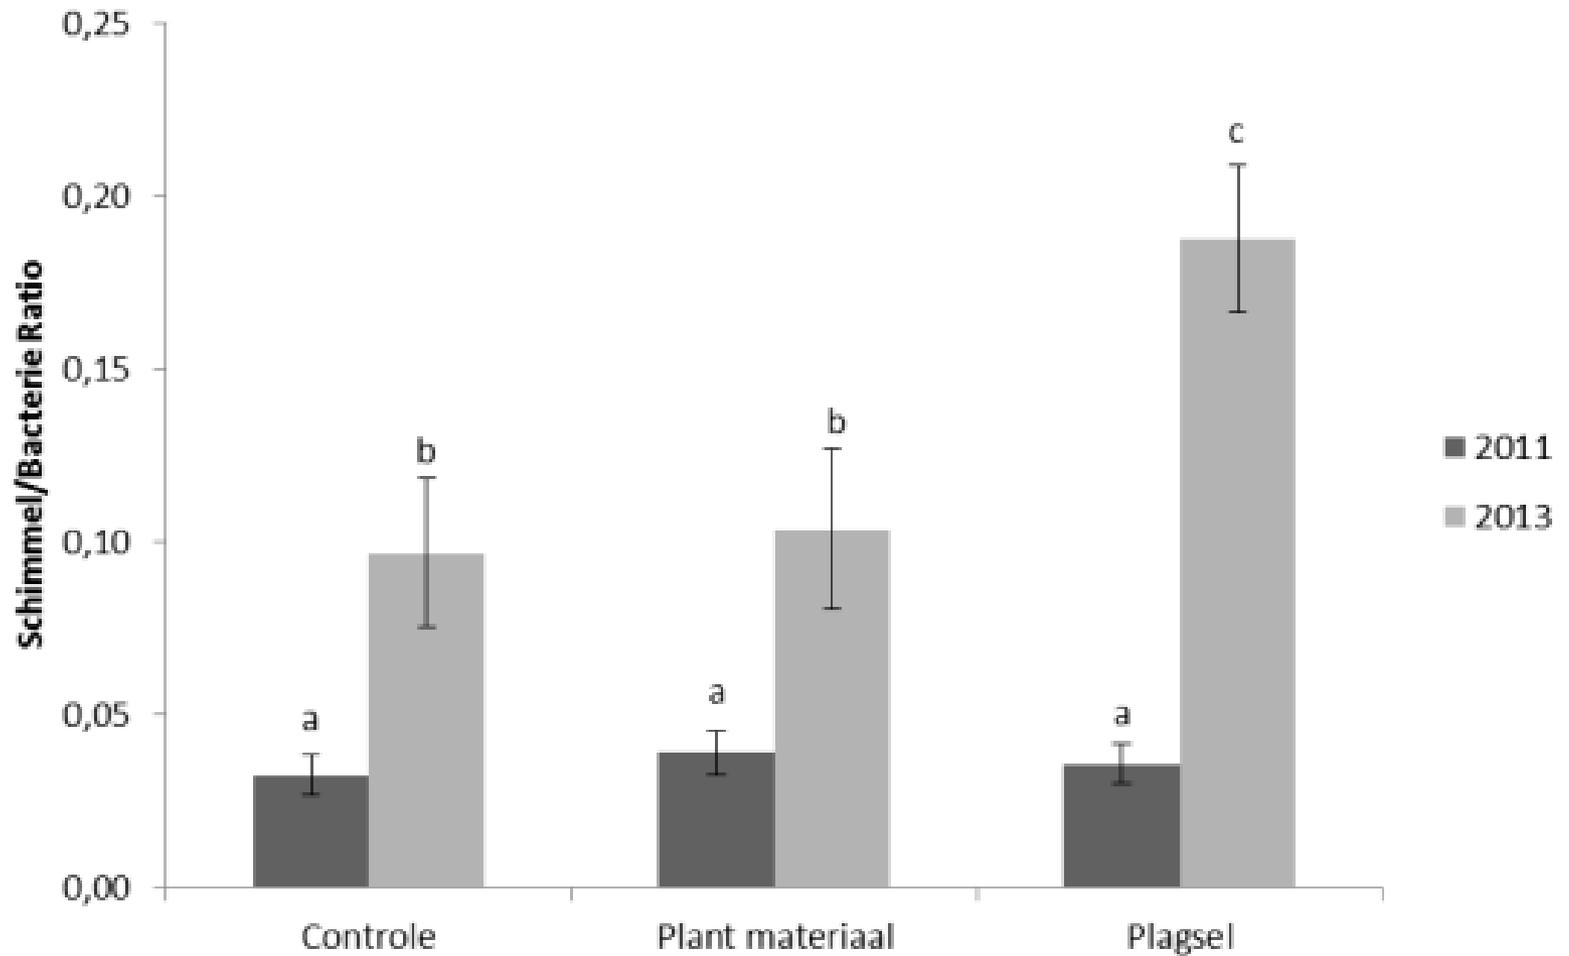

Definitief november 2016

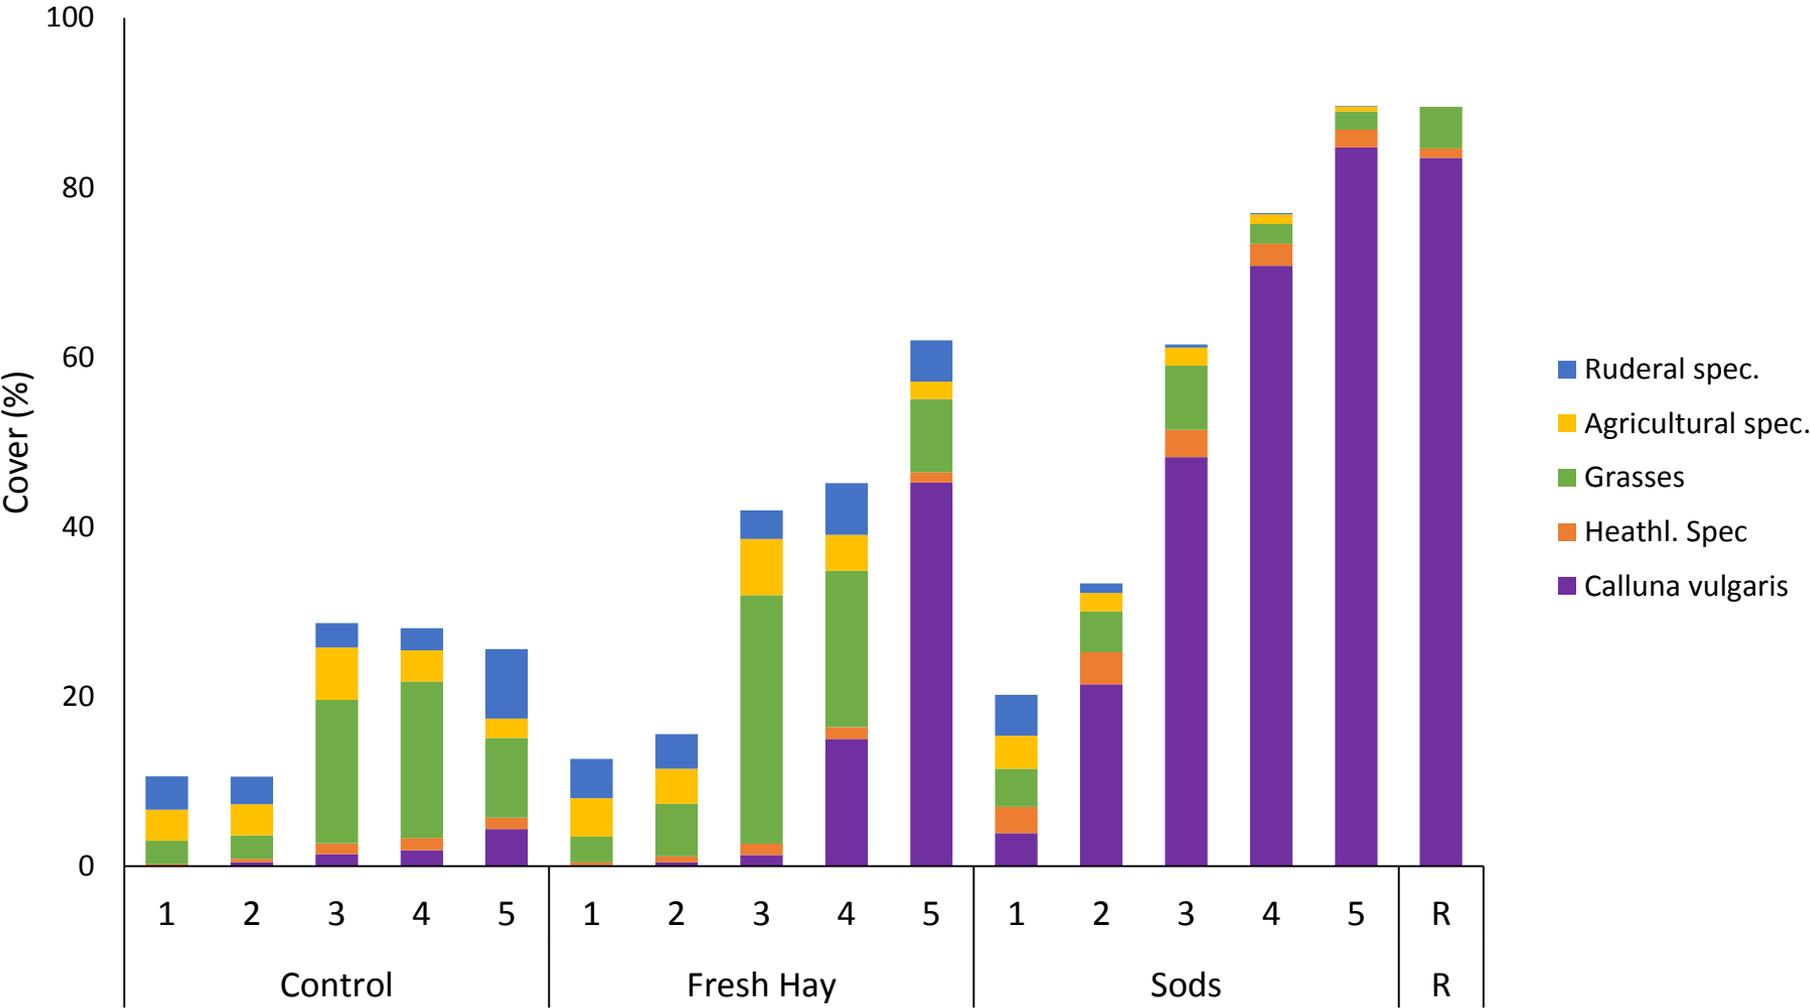

# Micro-organismen

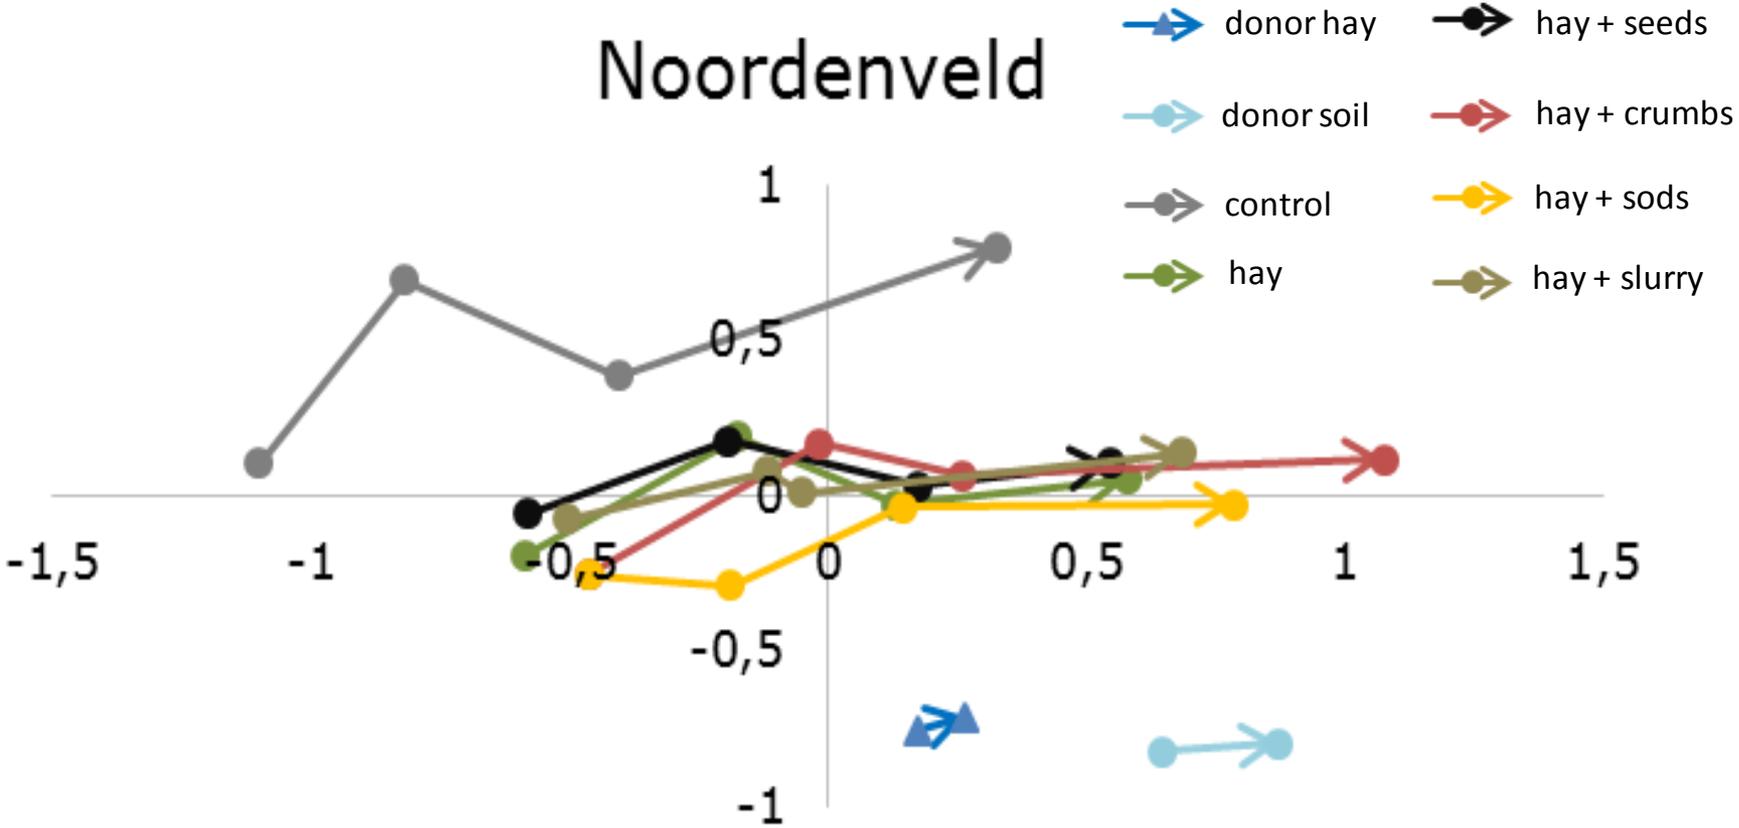

# Fungi:Bacteria Ratio

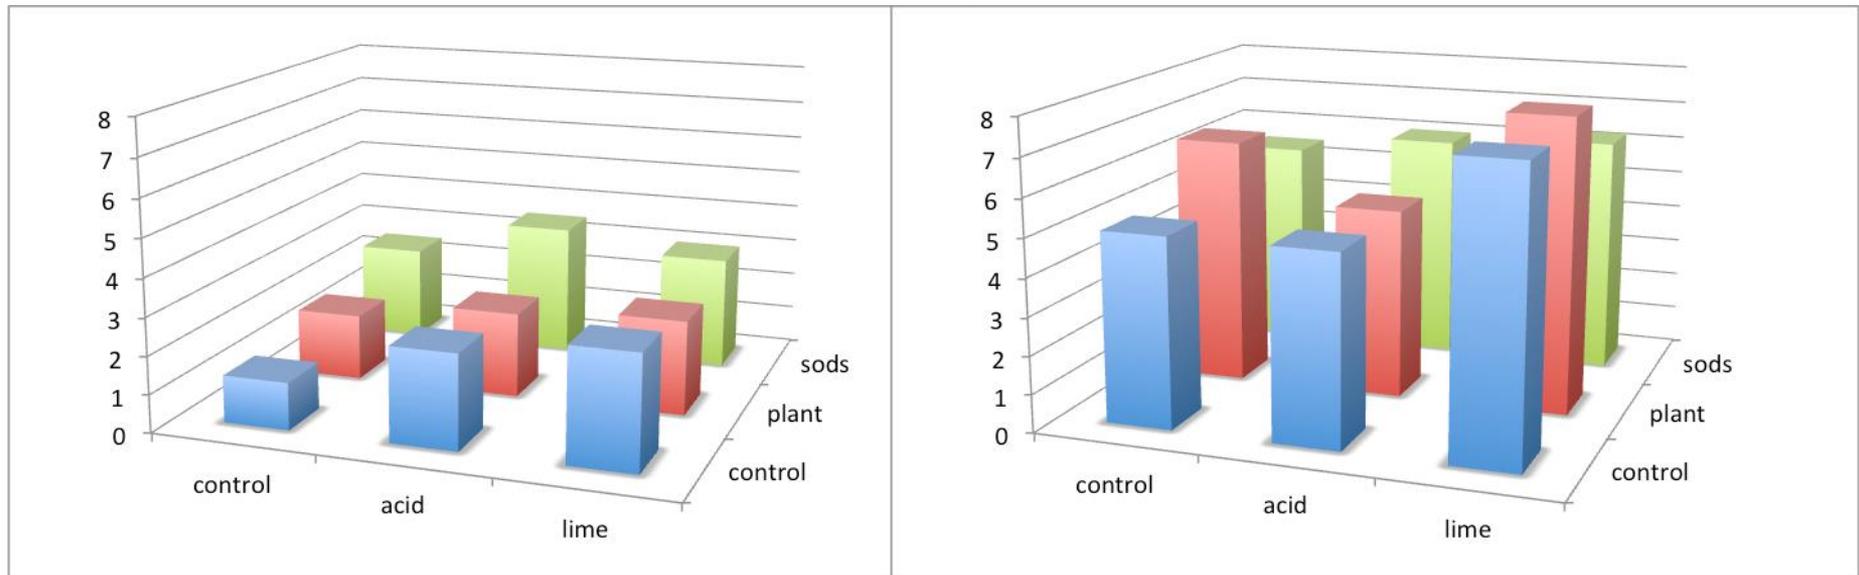

# Cover different groups (dry)

# Vegetation development Noordenveld

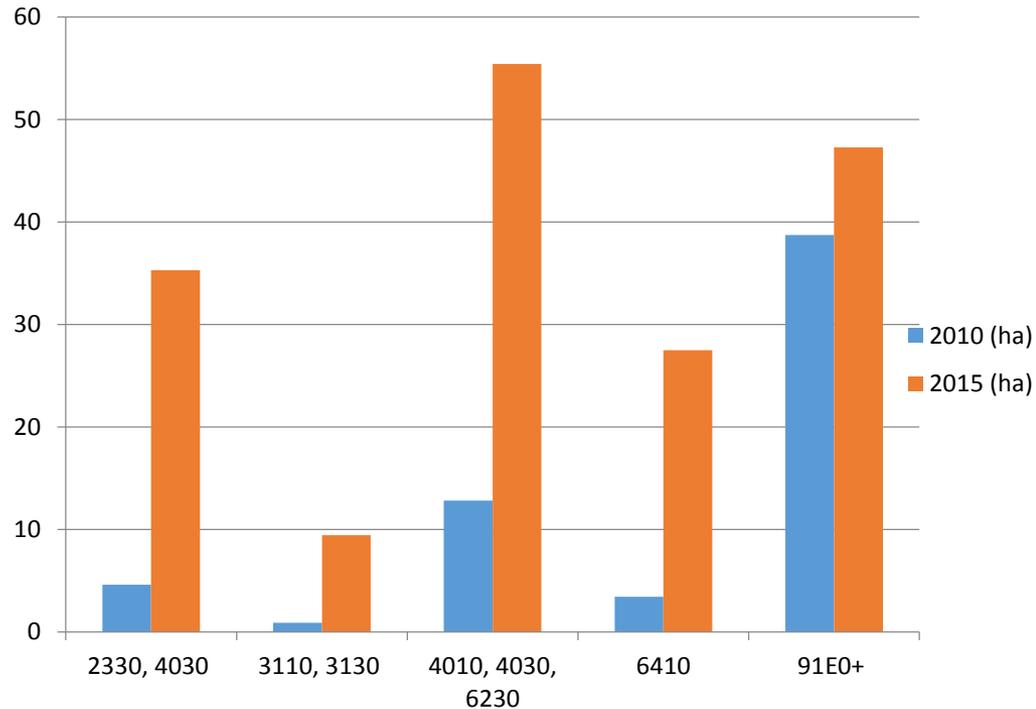

# Average number of ground beetles heathland species caught per treatment (4 areas)

in 2012

in 2013

# Results

Doelhabitat	Habitatcode	2010 (ha)	2015 (ha)
Dune heathlands	2310,2330, 4030	4,6006	35,2844
Oligotrophic waters	3110, 3130	0,8873	9,4203
Heathlands	4010, 4030, 6230+	12,803	55,4283
Molinia meadows	6410	3,4082	27,5042
Alder carrs	91E0+	38,743	47,2684

# Results

- Adder: 145 unique individuals
- Woodlarks: 1 → 10 pairs
- Nightjar: 0 → 8 pairs
- Great grey shrike: wintering individual

# Conclusions

## Feasibility of the approach

- Approach – ‘painful but effective’
- Citizen science recording is incredible and natural historians keen to help
- Utilise and stimulate further improvements in monitoring and surveillance
- Regionally important species previously off radar – if lost then at risk of national homogenisation
- Value in thinking about processes in habitats – this thinking is much more management relevant
- Set methodology - Refined and tested in three areas to date
- Partnership approach and getting involvement is important – extra time for co-ordination is worth effort

## RESTORATION

### Key

- Boundary: Site
- Existing Contours
- Restoration Contours
- Direction of Working
- Existing Vegetation
- Proposed Active Species Habitat
- Proposed Planting
- Headland
- Proposed Grassland
- Proposed Seasonal Wetland
- Grassland pond
- Proposed Heathland Scrub
- Proposed access track
- Proposed Swale
- Footpath
- Stileway

- Meadow
- Woodland
- Existing fencing
- New fencing

# Future challenges in research (I)

- 1 Critical loads based on vegetation changes, but what about stoichiometry affecting animals?
- 2 How to mitigate expected climate effects?
- 3 How to balance between disturbance and restoration management?

# Future challenges in research (II)

## 1 Burning and grazing as traditional measures do well:

- What is the best way and period of burning?
- What densities of sheep or goat do we need,
- Depending on soil type and conditions,
- Production level of the vegetation,
- Period in the season, size of the area,
- And should it be with shepherd or within fences?
